

R66T cloud services

Our cloud services have the advantage of being geo-tagged to actual locations. The system (aptly named SkyLocker™) allows for users, once connected to our Wi-Fi, to access information and files exclusive to the network venue. Within our digital ecosystem, local venues, customers and brands may deposit files and exchange information at a hyper local level, thus raising the relevance of every Wi-Fi connection across our network.

Some of the applications for our SkyLocker cloud service may include:

- Custom content designed to promote and enhance an event experience (music downloads, video interviews, virtual heat maps, chat windows, social tools)
- Aggregation of local menus relevant to the geo-location of the network
- User-contributed information such as flyer and posters that are relevant to the location
- Pre-loaded brochures for public access during events or conferences

The SkyLocker cloud service and its suite of apps is directly tied to the R66T network ecosystem, taking advantage of our hyper-locality, our digital publications and the Ad Builder. The R66T SkyLocker empowers users and connects business to relevant local consumers via a well established format which allows users and businesses to distribute files via authorized-PUSH (mobile alerts or autodooldownloading) and user-PULL methods. In some instances, the R66T Cloud services may offer subscription rates for premium services (bandwidth, premium content, streaming, uptime) especially when connecting to video content etc.
